SENTRI HOMES • COORDINATION TEAM

The Sentri Fulfillment Handbook

How we run coordination with Claude — one system for keeping every homeowner and every contractor tracked, so nobody slips no matter how many jobs are on the table.

Prepared by Bryan
Fulfillment Coordinator

Audience
Coordination / Fulfillment team

Version 1.4
August 2026

— Contents

Read 0–5 in order the first time through — each one sets up the next. Sections 6–8 you'll come back to.

0	**Why This Exists**	The real job — keeping track of everyone
1	**Getting Set Up on Claude**	Creating your account — free, about a minute
2	**How Connectors Work**	Notion, Quo, and Claude — and the permission model behind it
3	**Your Notion Connector**	Set up, then lock to pull-only
4	**Your Quo Connector**	Set up, and how I manage send permissions
5	**Cross-Referencing: Build Your Task List**	The core method — never drop a homeowner or a sub
6	**Claude in Chrome: Tracking Indeed Postings**	Rank candidates fast and reach subs through Quo
7	**Putting It Together**	The daily fulfillment loop, start to close
8	**Guardrails & Standards**	What stays human, and how not to get burned

0 Why This Exists

The hard part of this job isn't the work. It's keeping track of the people.

I've been the top fulfillment agent for the last two months, and this is the system that got me there. My only goal in writing it down is to help you make more money — because used right, it lets you carry double the jobs without dropping any of them.

Here's the thing nobody tells you when you start: making a materials list, placing an order, hiring a sub — those are the *easy* parts. They're mechanical, and you do them one job at a time. The part that actually buries coordinators is keeping track of everyone. When you've got 15 jobs open, you are managing **15 homeowners and 15 contractors at the same time**. Who's waiting on a callback. Who got promised a start date. Whose deposit still needs sign-off. Which sub is going out Monday and which one ghosted. That's the load, and no memory holds it for long.

> **THE WHOLE IDEA IN ONE SENTENCE**
>
> The way you win at this is **task lists** — one running list per job, one master view across all of them — with Claude holding the state and telling you every morning exactly who needs what.

The connectors are what make that real instead of a to-do app you forget to update. Because Claude can read the actual Notion card and the actual Quo thread, the task list reflects the real situation — who you actually owe a reply, what's actually still open — not what you happened to remember. Everything else in this handbook hangs off that.

Who this is for

The coordination and fulfillment team. Steven asked me to write the system down and share it with coordinators specifically — this isn't a company-wide thing. And you don't need anything special to start: it runs on a **free Claude account** — more on that next. If you coordinate jobs, this is your handbook.

1 Getting Set Up on Claude

This part takes about a minute. There's no Sentri company account — everyone creates their own.

Go to **claude.ai** and sign up using your **work Gmail account** — not a personal one. Click continue with Google, pick your Sentri email, and you're in. No approval needed from me or anyone else, and no cost to start.

1. **Create your account**

   At claude.ai, choose sign up and continue with Google, then select your **work Gmail**. Under a minute.

2. **You're on the free plan by default**

   Free is enough to run everything in this handbook — no card needed, nothing to cancel later.

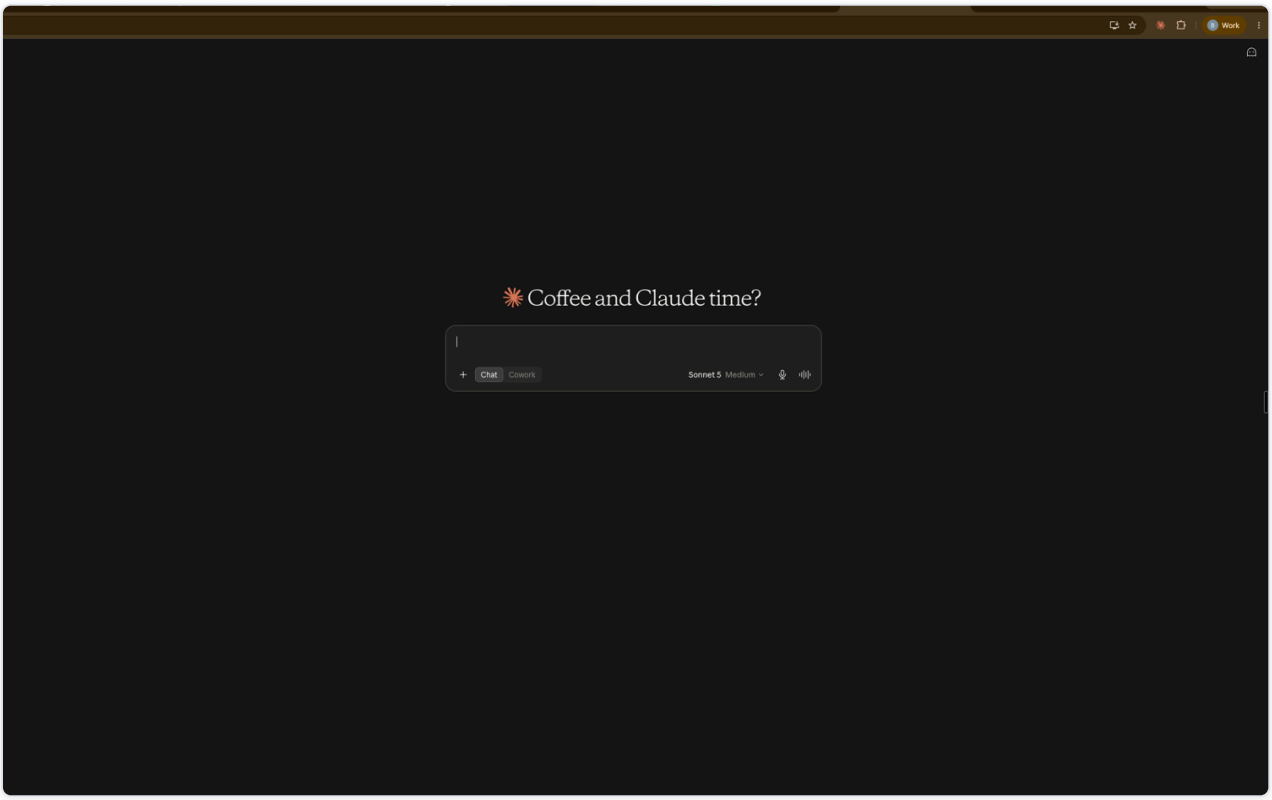

Figure 1. This is Claude, signed in and ready. Everything in this handbook happens from this screen.

> **ON PLANS**
>
> I highly recommend purchasing a Pro account for Claude. It'll triple the number of jobs you can carry, and that's just more money in your pocket — it really is the best money you'll spend on this. And this isn't a Claude-only thing: any AI assistant that can connect to Notion and Quo can run roughly this same process. We're standardizing on Claude as a team, but the method itself isn't tied to one tool.

Once you're signed in, everything else in this handbook — connectors, task lists, sourcing — happens inside that one account.

2 How Connectors Work

Before setting up Notion and Quo specifically, know what a connector actually does and how permissions work.

A connector is what lets Claude reach directly into another app instead of you copying information back and forth between tabs. Once Notion and Quo are connected, Claude reads your job cards and your message threads inside the same conversation.

SYSTEM OF RECORD

Notion

The job card is the truth. Scope, contract price, product specs, measurements, status, who's assigned, and the task checklist for that job. If it's not on the card, it didn't happen.

RECORD OF WHAT WAS SAID

Quo

Homeowner and contractor comms — texts, calls, voicemails — and where you send outreach from. This is the promise log and the thing that tells you who's waiting on a reply.

THE ONE THAT KEEPS TRACK

Claude

Reads the cards and the threads, holds the state across every open job, runs your task lists, drafts the next message, and flags what doesn't line up. It's the memory you don't have to keep.

Discord still carries internal team updates and email still carries supplier orders — nothing changes there. The loop that matters for this handbook is the one between the three pillars above.

> **WHY THIS BEATS MEMORY**
>
> On your best day you track all 30 people in your head. The system just makes that happen on every day — including the ones where you're running 15 jobs and two dumpsters didn't show up.

Where connectors live

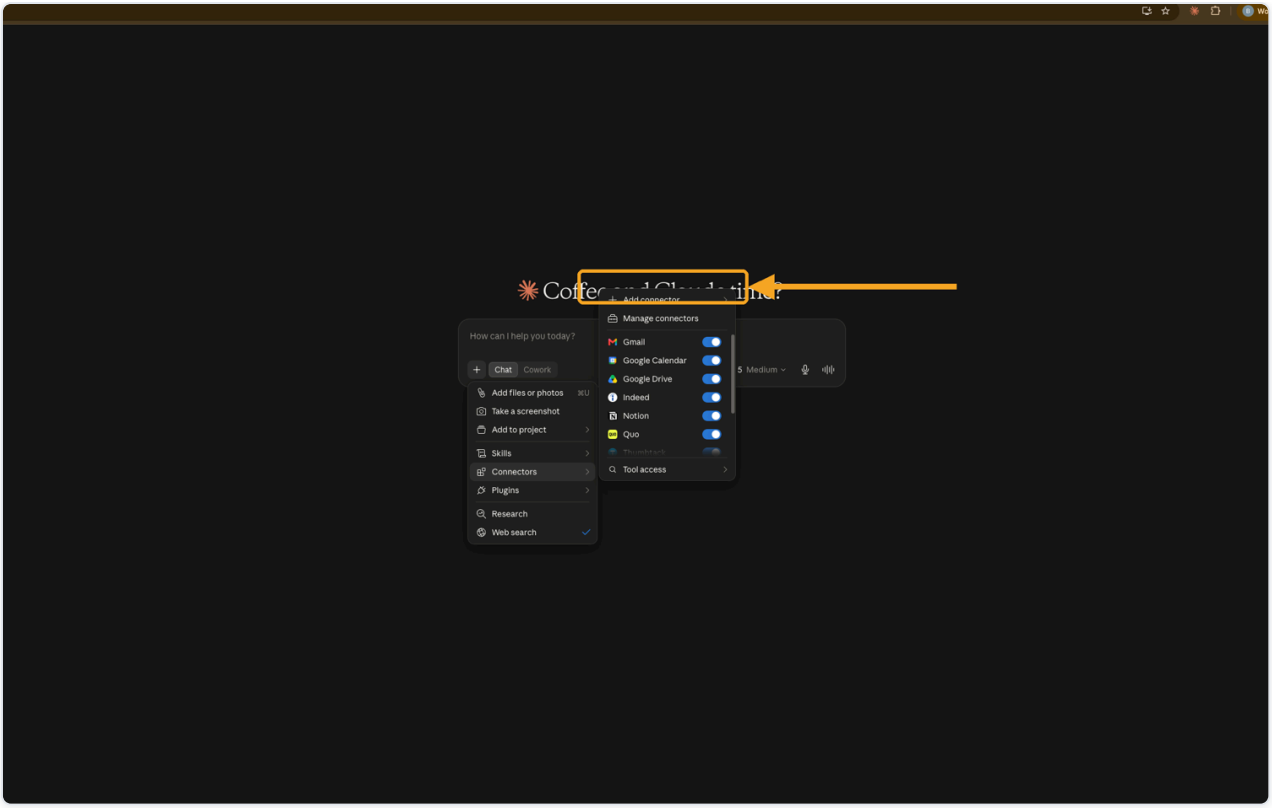

Figure 2. Open the **+** at the left of the message box (or type `/`) and click **Add connector**. Connectors you've already added also show up in this same menu with their on/off toggle.

Clicking **Add connector** opens the full directory, where you search for the app you want and connect it.

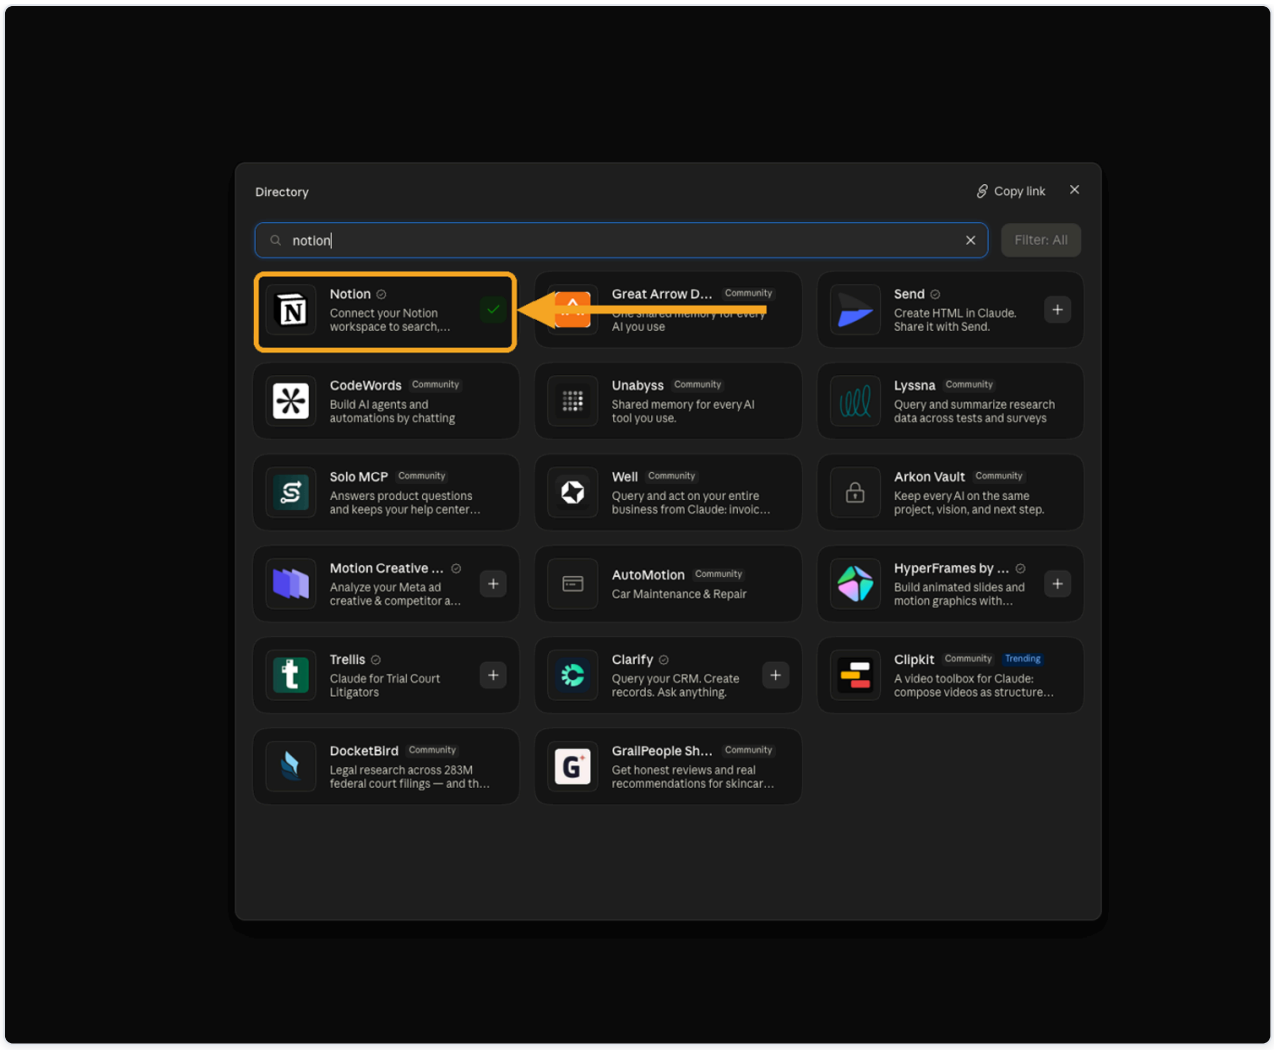

Figure 3. The connector directory. Search for the app by name — here, **Notion** — and click it to connect. A green check means it's already connected on this account.

Everything you add is also managed under `Settings → Connectors`, and every connector toggles on and off per conversation from the same **+** menu — leave Notion and Quo on for coordination work, and switch a connector off in a chat that doesn't need it.

The three permission levels

Every tool inside a connector gets one of three settings, and this is the piece that actually keeps the system safe:

- **Always allow** — for reading. Pulling cards, threads, and contacts is safe and constant, so you don't want a prompt every time.
- **Ask before acting** — for sending a message or creating a task. Claude proposes it, you approve with one tap.
- **Blocked** — for deleting, and for any writing you don't want Claude doing at all.

The next two sections set these specifically for Notion and for Quo — they are not set the same way for each.

3 Your Notion Connector

Notion is where Claude reads the job. Set it up once, then lock it to pull-only.

Connect it

Notion is a verified directory connector, so it's a one-click add followed by sign-in.

1. **Open the Connectors panel**

   In a chat, click the **+** in the lower-left of the message box (or type `/`), open **Connectors**, and pick **Notion**.

2. **Connect and authorize the Sentri workspace**

   Click **Connect**, sign in, and grant access. Make sure you authorize the **Sentri workspace**, not a personal one — that's the most common setup mistake.

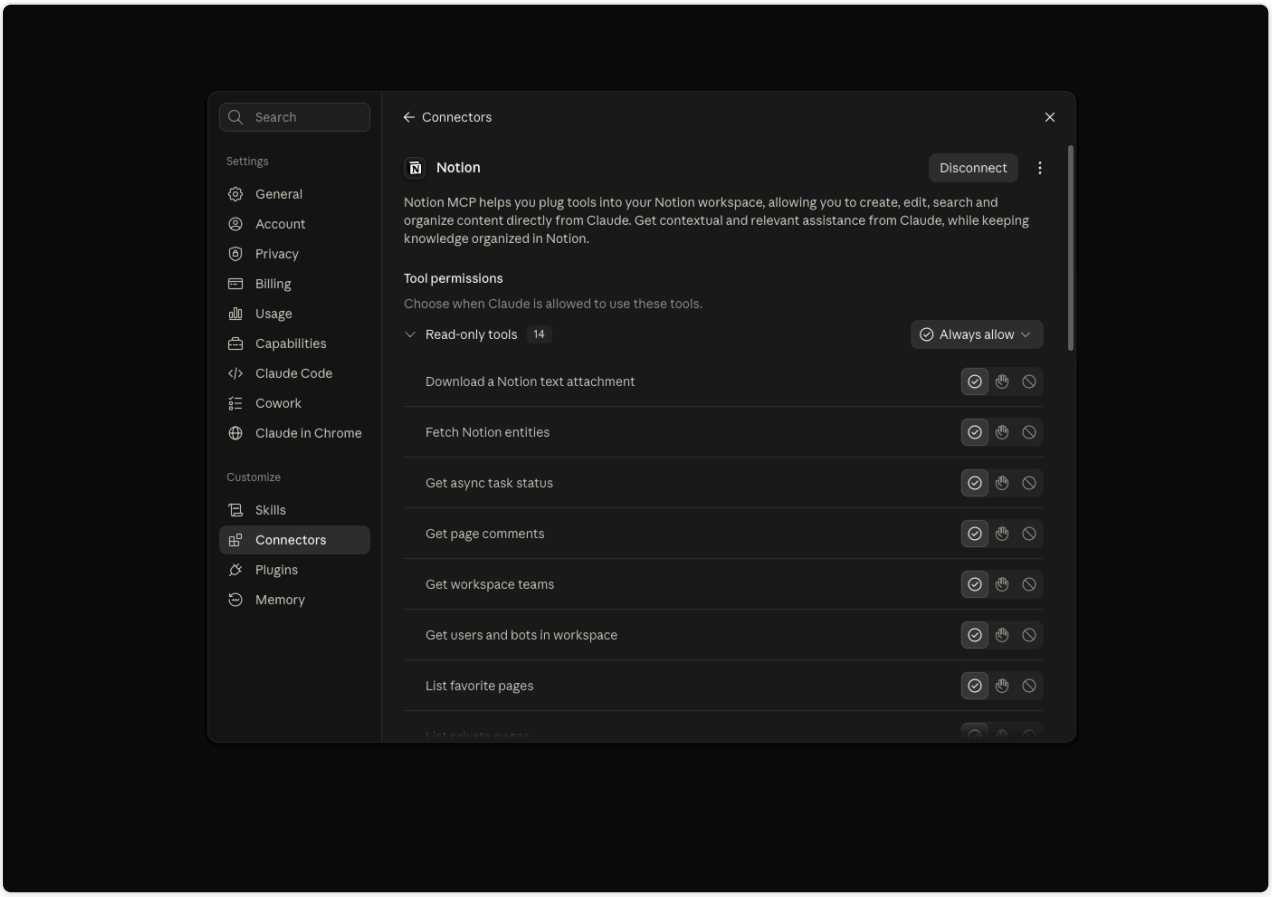

Figure 4. Notion connected, under `Settings → Connectors`. Set the read-only tools to **Always allow** so Claude can pull job cards without asking every time.

Lock it to pull-only

Set Notion's tools like this, and don't deviate:

- **All read tools → Always allow.** Pulling cards, threads, and contacts is safe and constant.
- **Every write and delete tool → Blocked.** Claude only ever pulls from Notion in this system — it never creates, edits, or pushes anything back into it.

> **NON-NEGOTIABLE — CONFIRM THIS WITH ME**
>
> Pulling from Notion is fine and expected. Pushing to it is not: every Notion write/delete tool needs to be set to **Blocked**, no exceptions. This is the one setup step I'm treating as mandatory rather than a suggestion — once you've set it, check it off with me directly. I'd rather confirm it once than have it be the thing that goes wrong.

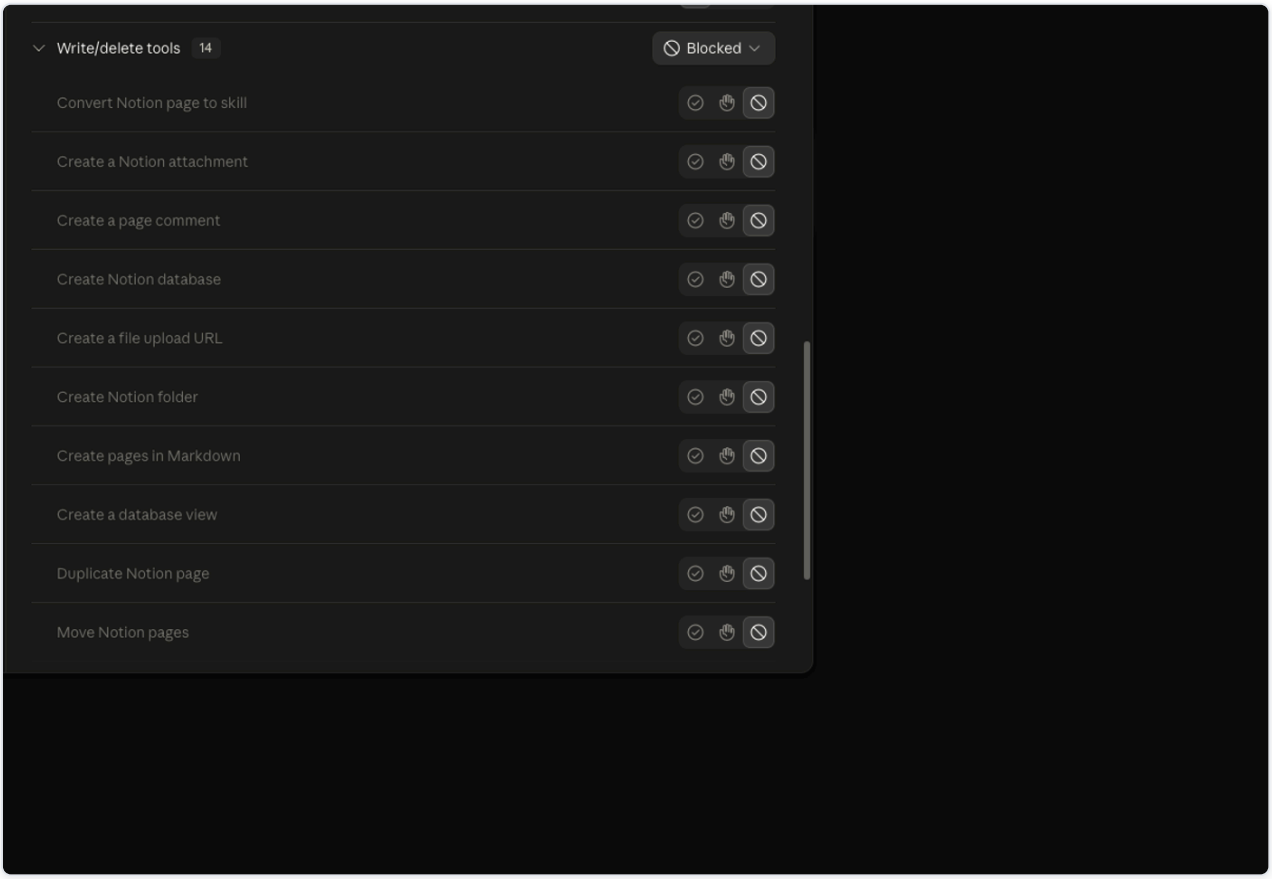

Figure 5. Notion's write/delete tools set to **Blocked** — you don't need Claude editing Notion for this system.

> **QUICK "IS IT WORKING?" TEST**
>
> Start a fresh chat and ask: *"Using Notion, find the job card for [a job you're on] and give me the scope, contract price, and current status."* If it comes back with the right card, you're live.

4 Your Quo Connector

Quo is where the real conversation lives — and where outreach goes out. A little more permission here, on a tighter leash.

Connect it

Quo runs on the same plumbing as Notion, so it connects the same way.

1. **Check the directory first**

   In the **Connectors** panel, look for **Quo**. If it's listed, add and authenticate exactly like Notion — and it won't use up your free custom-connector slot.

2. **If it's not listed, add it as your custom connector**

   Go to `Settings → Connectors → Add custom connector` and point it at Quo's MCP server endpoint (confirm the exact URL from Quo's own connector docs — ours resolves to `mcp.quo.com/mcp`). On the free plan this is your one custom connector, so make it count.

3. **Confirm the inbox**

   Ask Claude to list your Quo inboxes. If your Sentri number shows up, you're wired in.

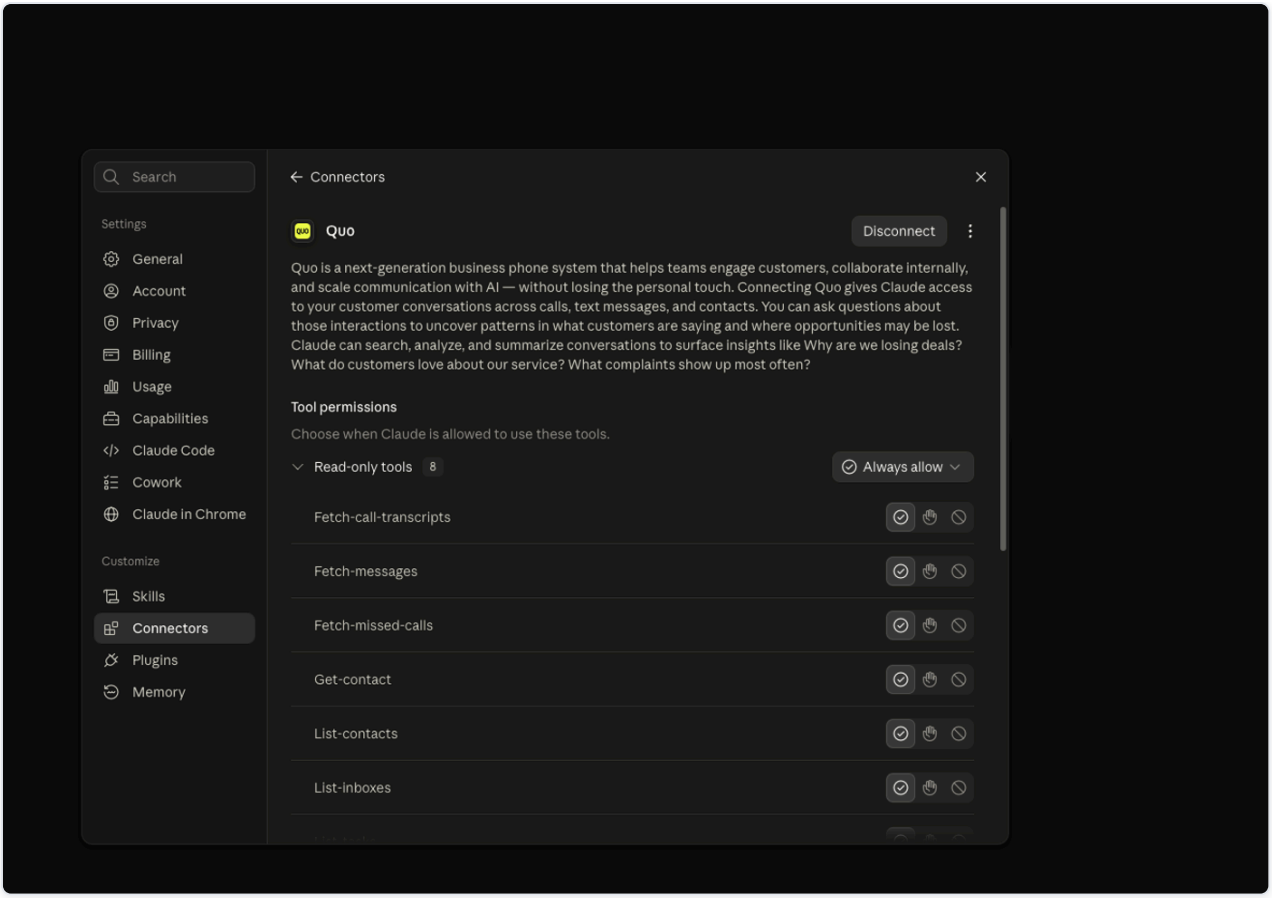

Figure 6. Quo connected — calls, texts, and contacts become readable to Claude, with the read-only tools on **Always allow**.

> **CUSTOM-CONNECTOR CAUTION**
>
> A custom connector lets Claude read and act inside Quo on your behalf, so only ever connect the official Sentri Quo endpoint. If a URL was handed to you in a message or a doc rather than coming from Quo's own site, don't add it — ask first.

How I manage it

Reading is wide open, same as Notion. Sending is where the leash comes in:

- **Reading — threads, calls, contacts → Always allow.** No prompts for pulling context.
- **Sending a message or creating a task → Ask before acting.** Claude drafts and proposes; you approve every batch with a tap before anything actually goes out.

This is what makes both outreach (Section 6) and the daily task upload (Section 5) safe to run without babysitting every message.

5 Cross-Referencing: Build Your Task List

This is the core of the whole thing. Everything else supports it.

Every open job has a running list of open items: call the homeowner back, order materials, get the sub's COI, book the dumpster, collect the final payment. On one job that's easy. On fifteen, the lists blur together and people fall through — and a homeowner who doesn't hear back for three days is how you lose a job the work was fine on.

So you keep two things:

- **A task list per job** — the open items for that homeowner and that sub, living on the Notion card (a checklist) or as Quo tasks. Pick one home for them and be consistent.
- **A master view across all jobs** — which you don't maintain by hand. You have Claude build it fresh each morning from the cards and threads.

The daily move

Once a day, have Claude build your priority list for you. It pulls your jobs from Notion, checks each one against what's *really* happening in Quo — the missed messages and recent calls you haven't circled back on — and hands you a ranked top 10, then loads it into Quo Tasks so it's in your workflow, not just a chat you'll scroll past. This is the single prompt to run first thing every morning.

MORNING PRIORITY LIST

```
# Run this first thing, every morning.
1. Using Notion, pull every job assigned to me — [your coordinator name] — from our jobs workspace.
2. For each job, cross-reference the card against what's really happening in Quo: my missed messages and recent calls on that homeowner and contractor. Where's someone waiting on me, or something slipping?
3. Do this for every single job — don't skip any.
4. From all of that, build a top 10 priority list for today, most urgent first, each as one clear action line (who, what, why now).
5. Then upload that list to Quo Tasks as individual tasks.
```

> **ONE APPROVAL ON THE UPLOAD**
>
> Step 5 writes to Quo, so keep the Quo task tool on **ask before acting** (Section 4). Read the top 10 first, then approve the upload with a tap — that way the list is yours before it lands in your workflow.

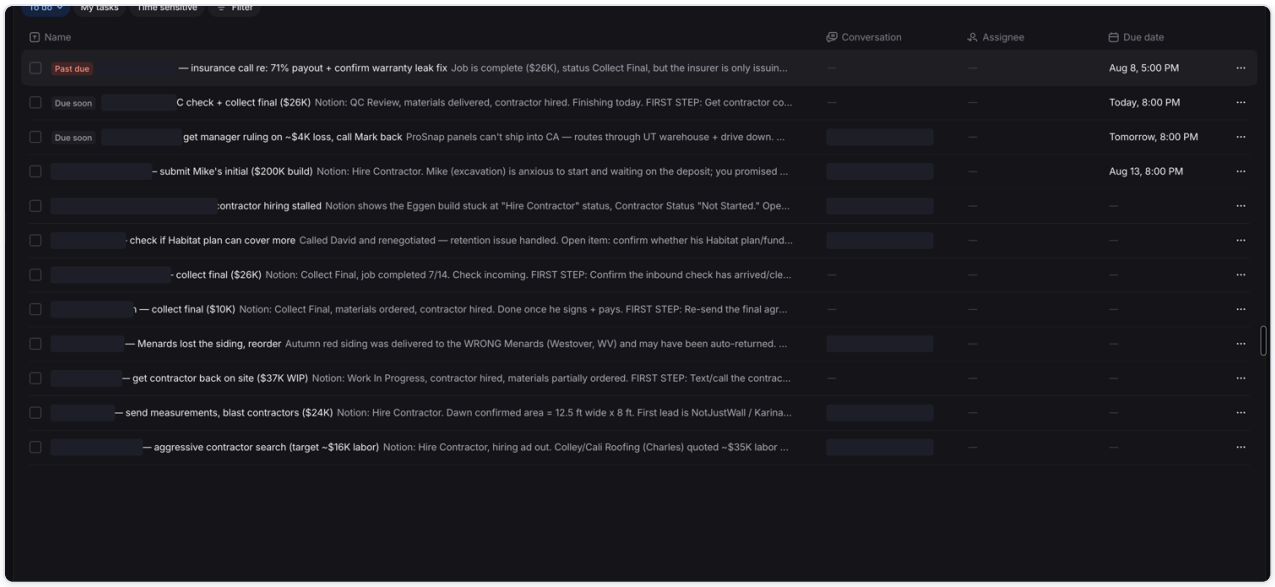

Figure 7. An example of what lands in Quo Tasks — each row is one job's next action, ranked, with status pulled straight from the card and thread. Client names and numbers redacted here for privacy.

> **THE WIN**
>
> You will never again "forget" a homeowner or let a sub go cold. The list catches them for you. That's the single biggest reason I can carry the volume I do.

Keeping the lists honest

The whole thing only works if the cards stay current. When you finish something or promise something new, put it on the card — not just in your head. Claude reconciles against what's written; if the card drifts, the task list drifts with it.

The other use: catching mismatches before they cost money

The same cross-reference move — Notion card against Quo thread — also catches problems before they cost money. Do it at two fixed gates on every job — **before you order materials** and **before a sub goes out**.

CHECK	THE QUESTION CLAUDE ANSWERS
Scope	Does the work on the card match what the homeowner was told in Quo? Any change orders discussed but never added to the card?
Measurements	Do the square footages / counts match the measurement report? Watch for flat sections counted as roof, or stairs and waste left out.
Product spec	Does the product on the card match what was sold and what's in the linked order? Gauge, series, color, fastener — the quiet downgrade lives here.

Price & margin	Contract price vs. real material + labor cost. Inside the 40–50% gross target, or priced to beat a competitor and quietly eating margin?
Timeline	Dates promised in Quo vs. what's realistic given lead times, cure windows, and sub availability. Flag anything already slipped.

WORKED EXAMPLE — HOW A SAVE ACTUALLY LOOKS

A metal-roof job comes in sold as a 28-gauge concealed-fastener panel. Claude reads the card and flags that the *linked material order* is a 29-gauge exposed-fastener panel — a downgrade the homeowner never agreed to, justified in the thread by a "state code ban" on the heavier gauge that doesn't actually exist. That's the difference between shipping the right product and a callback, a refund, or a homeowner who works in construction and knows exactly what they were shorted. One prompt surfaced it.

RECONCILE A JOB

```
Using Notion and Quo, reconcile the card and the full thread for [JOB / homeowner]. List every place they disagree across scope, measurements, product spec (gauge / series / color / fastener), price and margin, and promised dates. For each, say which source says what, and flag the money-losers I need to fix before I order.
```

Read the output, then **you** decide what's real. Claude does the careful reading; the judgment call — and any fix to the card, the order, or the homeowner — stays with you.

6 Claude in Chrome: Tracking Indeed Postings

Finding a sub shouldn't eat your afternoon. This is the part that lets you carry double the jobs.

When you need a sub, don't read resumes one at a time. Pull up your candidates in Indeed with the **Claude in Chrome** extension and have Claude read across the whole list for you, then hand you the five most qualified for that trade and location.

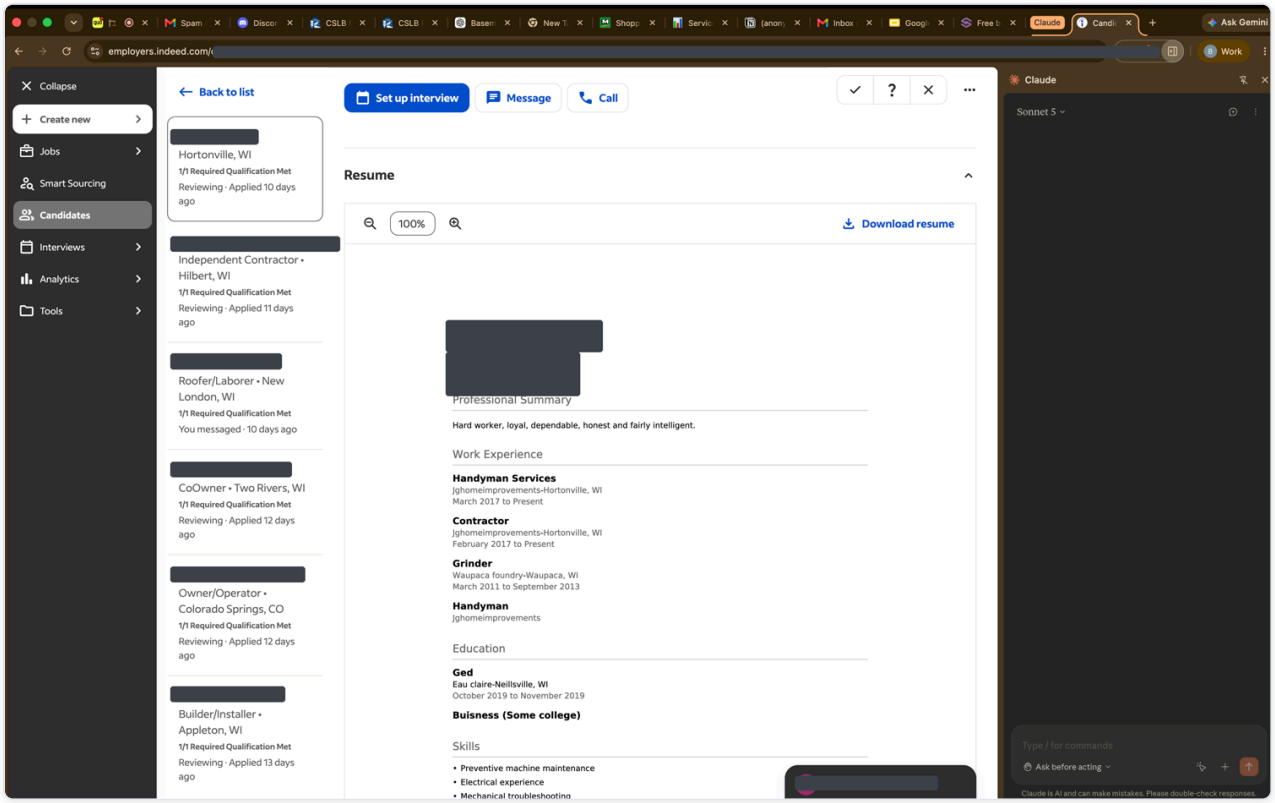

Figure 8. Indeed candidates open with Claude in Chrome (right). Claude reads the resumes on the page and ranks the best fits — applicant name and contact details redacted here for privacy.

The two-step play

1. ### Rank the resumes

   With your Indeed candidate list open and the Claude extension in the side panel, ask Claude to read across the resumes and pull the **top five** most qualified for the trade and area — with a one-line reason each. Minutes instead of an afternoon.

2. ### Reach out through Quo

   Take those five phone numbers into a chat with Quo connected and have Claude send each of them a **templated** outreach text — who you are, the trade, the city, and how to reply. Quo sends them as individual 1:1 messages, and with the Quo send tool on *ask before acting* (Section 4) you approve the batch before it goes out.

This works for materials too

The same move — Claude reading the real job details and handing them to a tool built to act on them — works for building a materials list, not just finding a sub. Have Claude pull the job's scope off the Notion card and write it up as a short, plain-language project summary. Paste that summary into Home Depot's **Build your list with AI** tool (in Add Materials on any Home Depot Pro list), and it turns your description into an actual product list you can review and order from.

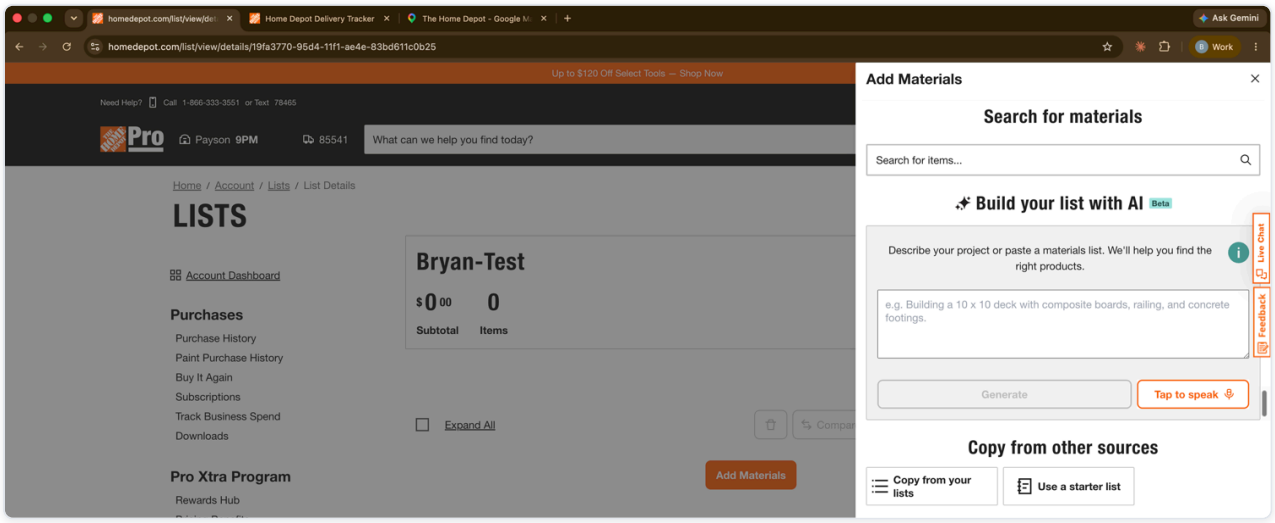

Figure 9. Home Depot Pro's **Build your list with AI** panel. Drop in the job scope summary Claude pulled from Notion and it generates the materials list for you to check against the job.

> **SAME IDEA, DIFFERENT TOOL**
>
> Claude's job here is just getting the real scope out of Notion in a clean, usable form. Where you hand that off — Home Depot's list builder, a sub's phone, wherever — changes by task. Check whatever list comes back against the actual card before you order; the tool doesn't know the job, only the description you gave it.

7 Putting It Together

The repeatable path from a new job to a closed one. Claude has a job at each step; the decisions stay yours.

1. **Intake & verify the card**

   New job lands on a Notion card. First thing: reconcile it and stand up its task list (Section 5). Catch scope, measurement, spec, and price problems now — before anything's ordered — while they're still free to fix.

2. **Source & vet the sub**

   Build a call list for the trade and location, or rip through resumes with Claude in Chrome (Section 6). Vet before hiring: Secretary of State check, current COI. The deposit gate holds — any deposit needs Monte or Steven sign-off.

3. **Schedule the logistics**

   Line up start date, dumpster, and delivery against real lead times and cure windows. Use Calendar so cure times (grout, sealer) and dumpster drops don't collide with the sub showing up.

4. **Communicate through Quo**

   Have Claude *draft* the homeowner and contractor updates from the current card state. You review every draft on an active job, then send.

5. **Track to close**

   Keep the card and its task list current — status, payments, holdbacks, warranty fixes. Run the morning priority list (Section 5) so nobody sits.

> **THE LOOP FEEDS ITSELF**
>
> Every step reads from the card and writes back to it. Keep the card honest and the whole loop — task lists, reconciliation, drafts — stays honest with it.

8 Guardrails & Standards

This system makes you faster. These rules keep faster from turning into sloppier.

CLAUDE DRAFTS. HUMANS DECIDE.

Every number, message, and material list is a draft until a coordinator confirms it. Claude reads faster and more consistently than any of us — but it doesn't own the job. You do. Read the output before you act on it, every time, and enforce it at the connector level (Sections 3–4): Notion pull-only, Quo sends on *ask*, deleting blocked everywhere.

TWO KINDS OF MESSAGES, TWO RULES

Job communication — anything to a homeowner or a contractor on an active job — is drafted, read, and sent by a person. A wrong date or price sent in your name is worse than a slow reply. **Cold sourcing outreach** can be templated and sent as a batch with *ask before acting*, because the content is a fixed template you already approved. Never blur the two.

MONEY STAYS HUMAN

The deposit policy doesn't change: **any deposit needs Monte or Steven sign-off.** Claude can prep the request and lay out the numbers; it never approves or moves money.

When two sources disagree

Reconciliation surfaces conflicts; it doesn't resolve them. The order of trust:

1. **The measurement report** beats a number typed on the card.
2. **The signed contract** beats a verbal promise — but a promise in Quo is still a real expectation to manage, not ignore.
3. **The actual linked order** is what's really shipping, whatever the card's description says.
4. When it's above your line — a spec downgrade, a pricing error, a disputed scope — **escalate**. Don't paper over it.

Data hygiene

- Only connect the official Sentri Notion workspace and Quo endpoint. Never add a connector URL that arrived in a message or document without checking.
- Treat homeowner threads *and* applicant resumes as personal data — names, emails, phone numbers. Don't paste them where they don't belong, and redact them out of anything you share.
- Keep the card as the source of truth. Fix things *on the card*, not just in your head.

Sentri Fulfillment Handbook • v1.4 • Internal — coordination team. Runs on a free Claude account. Connector steps reflect Claude's connector flow as of August 2026; if the interface has moved, connect from Settings → Connectors and the method still holds. Maintained by Bryan — send corrections and better prompts my way.
